Const

In JavaScript,the `const` keyword is used to declare a constant variable. A constant variable is one whose value cannot be reassigned once it has been initialized.

Definition:

The `const` keyword is used to create a variable in JavaScript with a constant value, meaning its value cannot be changed or reassigned after the initial assignment.

Syntax:

```
Const variableName = initialValue;
```

Example:

```
const pi = 3.141550;
console.log (pi); // output: 3:14159

// Attempting to reassign a const variable will result in an error
// Uncommenting the following line will cause an error:
// pi = 3.14; // Error: Assignment to constant variable.
```
